

```
entt::basic_registry  
::group_handler< exclude  
_t< Exclude... >, get_t  
< Get... >, Owned... >::discard_if
```

```
entt::basic_registry  
::group_handler< exclude  
_t< Exclude... >, get_t  
< Get... >, Owned... >::maybe  
_valid_if
```

```
entt::basic_registry  
::current
```

The diagram illustrates two function pointers pointing to a static member variable. On the left, two white boxes with black borders contain C++ code snippets. The top box shows a function signature for `discard_if`, and the bottom box shows a function signature for `maybe_valid_if`. Both functions are members of `entt::basic_registry::group_handler`. Blue arrows point from the `discard_if` and `maybe_valid_if` functions to a gray box on the right. The gray box contains the code for the static member variable `entt::basic_registry::current`, which is of type `entt::basic_registry`.
